Protective foiling

To prevent surface damage such as scratches that can occur during handling, transportation or processing, we recommend you ask for your Thermopal products to be supplied “with protective film” when you order them.

This is particularly important if the surfaces are high gloss or smooth. Our products with real metal surfaces are already shipped with self-adhesive protective foil.

Please observe the following to ensure that you have the full benefit of the protective packaging:

- We suggest random checks of the incoming goods. Later complaints or claims for damages can only be submitted up to the point of the incoming goods check.
- Vacuum transportation of foiled boards is at the owner’s risk.
- We accept no responsibility for damage to products that is the result of impairments from handling and/or inappropriate processing.
- Please store foiled products in cool and dry condition. Avoid direct sun light and UV rays.
- Remove the protective foil before using the product, and no later than six months after receipt. Otherwise we cannot guarantee that you will be able to remove the foil easily or completely.
- The protective foil is to be recycled in accordance with EWC code 200139 (plastics as a separately collected fraction).
